Introduction

This vignette demonstrates a complete Bayesian inference pipeline using Turing.jl with an ODE model defined via ModelingToolkit.jl. This mirrors the R odin2/dust2/monty workflow: define a model, generate synthetic data, specify priors, run MCMC, and analyse posteriors.

For a deterministic ODE model with Poisson observations, Turing.jl can embed the ODE solver directly inside the `@model`, letting the NUTS sampler explore the parameter space efficiently.

Model and Data

First, define the deterministic SIR model and generate synthetic observations.

```
using ModelingToolkit
using ModelingToolkit: t_nounits as t, D_nounits as D
using DifferentialEquations
using Turing
using Distributions
using CairoMakie
```

```julia
using Random
using Statistics

@parameters  =0.5  =0.1 N_pop=1000.0
@variables S(t)=990.0 I(t)=10.0 R(t)=0.0

eqs = [
    D(S) ~ -  * S * I / N_pop,
    D(I) ~   * S * I / N_pop -   * I,
    D(R) ~   * I,
]

@named sir = ODESystem(eqs, t)
sir = structural_simplify(sir)
```

```
Model sir:
Equations (3):
  3 standard: see equations(sir)
Unknowns (3): see unknowns(sir)
  R(t)
  I(t)
  S(t)
Parameters (3): see parameters(sir)

  N_pop
```

Generate Synthetic Data

We simulate the deterministic model and add Poisson noise to the daily incidence.

```julia
prob_true = ODEProblem(sir, [], (0.0, 50.0), [sir.  => 0.5, sir.  => 0.1])
sol_true = solve(prob_true, Tsit5(); saveat=1.0)

R_vals = sol_true[sir.R]
daily_incidence = max.(diff(R_vals), 1e-6)

Random.seed!(1)
observed = [rand(Poisson( )) for  in daily_incidence]
data_times = sol_true.t[2:end]
println("Observed cases (first 10): ", observed[1:10])
```

```
  Warning: `SciMLBase.ODEProblem(sys, u0, tspan, p; kw...)` is deprecated. Use
  `SciMLBase.ODEProblem(sys, merge(if isempty(u0)
      Dict()
  else
      Dict(unknowns(sys) .=> u0)
  end, Dict(p)), tspan)` instead.
  @ ModelingToolkitBase ~/.julia/packages/ModelingToolkitBase/uIKoY/src/deprecations.jl:53
Observed cases (first 10): [1, 1, 1, 4, 9, 4, 13, 13, 24, 37]
```

Set Up Inference

The Turing model embeds the ODE solver. For each proposed (,), we solve the ODE, compute daily incidence, and evaluate the Poisson likelihood.

```julia
sir_sys = sir  # capture for use in model closure

@model function sir_inference(observed, data_times)
    # Priors (matching R monty_dsl: Gamma with shape, scale parameterisation)
     _est ~ Gamma(2, 1/4)      # shape=2, scale=1/4 → mean=0.5
     _est ~ Gamma(2, 1/20)     # shape=2, scale=1/20 → mean=0.1

    # Solve ODE
    prob = ODEProblem(sir_sys, [], (0.0, maximum(data_times)),
                      [sir_sys.  =>  _est, sir_sys.  =>  _est])
    sol = solve(prob, Tsit5(); saveat=data_times)

    if sol.retcode != ReturnCode.Success
        Turing.@addlogprob! -Inf
        return
    end

    # Daily incidence from ΔR
    R_vals = sol[sir_sys.R]
    R_at_0 = 0.0

    for i in eachindex(observed)
        R_prev = i == 1 ? R_at_0 : R_vals[i - 1]
          = max(R_vals[i] - R_prev, 1e-6)
        observed[i] ~ Poisson( )
    end
end
```

```julia
model = sir_inference(observed, collect(data_times))
```

```
DynamicPPL.Model{typeof(sir_inference), (:observed, :data_times), (), (), Tuple{Vector{Int64
```

Run MCMC

We use the NUTS sampler — Turing.jl's default gradient-based sampler — which is more efficient than the random walk used in R monty.

```julia
chain = sample(model, NUTS(), 2000; progress=true)
```

```
